Topic 10: Gmail Integration – Final Workflow Summary

1. Project Title

Gmail Integration – Automated Personalized Email Sending Using n8n

2. Objective

The objective of this project was to integrate n8n with Gmail using OAuth2 authentication and send personalized plain-text emails using dynamic customer information.

3. Workflow Structure

The completed workflow contains three nodes:

1. Manual Trigger
2. Mock Customer Data
3. Send Personalized Email

4. Key Features Implemented

- Manual workflow execution.
- Creation of mock customer data.
- Gmail OAuth2 account connection.
- Dynamic recipient email selection.
- Personalized email subject.
- Personalized plain-text message body.
- Successful Gmail message submission.
- Verification of email delivery.

5. Execution Results

The workflow successfully executed and Gmail returned the following output:

Output Field	Result

id	1a1cf8410c2bd6d6
threadId	1a1cf8410c2bd6d6
labelIds	SENT

The email was also checked in the recipient inbox and delivery was verified.

6. Learning Outcomes

Through this project, the following concepts were practiced:

- Connecting Gmail to n8n.
- Using Gmail OAuth2 authentication.
- Configuring the Gmail Send operation.
- Referencing JSON fields using n8n expressions.
- Personalizing email recipients, subjects, and message bodies.
- Executing and validating an automated email workflow.

7. Final Status

Workflow Status: Completed

Execution Status: Successful

Email Delivery: Verified

Test Result: PASS

8. Conclusion

The Topic 10 Gmail Integration project was successfully completed. The workflow demonstrates how n8n can use dynamic customer data and Gmail OAuth2 authentication to send personalized plain-text emails automatically.

The implementation and testing objectives were achieved.
